

## **Axxon Intellect Lite – an advantageous offering from AxxonSoft for small and mid-sized sites**

The AxxonSoft Company is introducing a new mid-priced product to the market – Axxon Intellect Lite. Now along with Axxon Smart PRO, you can buy a four-server version of the Axxon Intellect Enterprise software package's video system for an excellent price. The cost of remote workstation software for Axxon Intellect Lite is also reduced, while the number of workstations and video cameras in the system is unlimited.

Otherwise Axxon Intellect Lite is a fully functioning version of the Axxon Intellect Enterprise software package's video subsystem, which supports an interactive map of the guarded location, event protocol, and rich capabilities for creating automatic scripts for system reactions to events. Automatic and automated scripts help video surveillance system operators substantially, which positively affects the security service's overall work effectiveness.

For the creation of simple scripts, one can use a simple graphic method which consists of selecting the actions the system should execute if a specific event occurs. And for the creation of even the most complex scripts, one can use the popular scripting languages JavaScript and VB Script. Thanks to this, in order for a person who knows one of these languages to learn about the possibilities for programming in Axxon Intellect Lite, he or she must simply learn its control functions.

As in all AxxonSoft products, integration of IP devices into Axxon Intellect Lite is implemented through Drivers Pack, a module specially developed by AxxonSoft to which support for new IP devices is regularly added. Currently the module supports over 280 models of IP cameras and IP video servers. You can download the latest version of Drivers Pack free from the AxxonSoft site and install it directly into a working system. Thus, Drivers Pack makes possible the addition of support for new IP devices without waiting for the release of a new version of Axxon Intellect Lite or reinstalling the entire system.

Another advantage of Axxon Intellect Lite is the integration of a fully functioning POS module. The POS transaction monitoring module is an effective tool for reducing losses at points of sale, evaluating the work of cashiers, and monitoring payment for purchases. It synchronizes the video image coming in from a video camera aimed at the register with the text and event information coming in from the point of sale. As a result, during surveillance in real time or by viewing video recordings from the archive, on the screen the operator sees a video image of the transaction with the customer at the register and text information as captions. This approach allows one to see the full picture of events occurring at the point of sale.

Because of its extraordinarily advantageous combination of price and functionality, Axxon Intellect Lite is ideal for small and mid-sized sites. And thanks to the possibility of incorporating the POS monitoring module into the system, its use will be especially effective at retail businesses such as shops, filling stations, restaurants, and cafes.

Axxon Intellect Lite is an advantageous offering for those who do not need a large system, but who want to avail themselves of the full power of the flagship of the AxxonSoft product line.
